

NLP Text Classification Project

Project title

NLP Text Classification Project

NLP task and domain/application area

- Task: text_classification
- Domain: replace-with-domain
- Application area: replace-with-application-area

Motivation and problem statement

Explain why this NLP problem is important. Describe the problem being solved.

Expected final product

Describe the final NLP system or output. It improves: Explain what manual/slow/limited process this improves.

Research questions

- RQ1: Replace with a clear objective or research question.
- RQ2: Replace with a measurable comparison or analysis goal.

Dataset

Source/provenance: Sample local CSV for reproducible development; replace with final dataset source. Created for smoke testing only; not a final research dataset.

Size/structure: 12 rows, 3 columns; columns: id, text, label; labels: negative: 6, positive: 6

Domain: demo

Suitability: CSV text and label columns support the configured classification baseline.

Known challenges: Small sample dataset is not suitable for final claims.; Replace with real dataset and document noise, imbalance, or language issues.

Team responsibilities

- Team Member 1: Data collection and preprocessing; Dataset documentation
- Team Member 2: Feature engineering and modelling; Experiment tracking
- Team Member 3: Evaluation and error analysis; Visualisation and reporting
- Team Member 4: System/demo development; Proposal PDF and submission checklist

GitHub repository link

replace-with-private-repo-url

Submission checklist

- [] Confirm the GitHub repository is private.
- [] Add instructor collaborators drelhaj and whistle-hikhi.
- [] Include the final GitHub repository link in the proposal PDF.
- [] Export the proposal PDF using 12 pt Times New Roman or a Times-compatible font.
- [] Submit the PDF to Canvas by the deadline.
